Repairs Overview

Odoo 19 Enterprise · Repairs

The Repairs module manages repair orders for products returned by customers or internally repaired — tracking parts used, labour, and generating invoices.

1 What Repairs does

Repairs

Repairs tracks the process of fixing a product: receiving the broken item, diagnosing it, ordering replacement parts, performing the repair, and returning the product to the customer. Each repair order is linked to a customer record and can generate an invoice for parts and labour. It connects with Inventory for parts consumption and Accounting for invoicing.
